Rippling Hiring Team

Re: Senior Software Engineer, Frontend Full Stack - HR Product

Dear Rippling Hiring Team,

I am interested in the Senior Software Engineer, Frontend Full Stack - HR Product role because Rippling is building the kind of enterprise product surface where frontend architecture matters at the deepest level. A unified workforce platform has to make dense, sensitive, compliance-heavy workflows feel clear and usable, without losing the rigor required underneath.

At Microsoft, I own platform architecture, API consistency, and quality standards for a shared library of 120+ Web Components used across Microsoft Fabric and Power BI, with React and Angular wrappers that support adoption across frameworks. My work lives at the intersection of product design, frontend systems, accessibility, documentation, generated metadata, and production code. I have built end-to-end pipelines that keep tokens, scaffolding, components, wrappers, validation, docs, and Storybook metadata aligned, reducing component delivery time from two to three weeks to roughly three days.

What I would bring to Rippling is a mix of product-focused frontend engineering and systems-level platform thinking. I care about polished, intuitive user experiences, but I also care about the machinery that keeps those experiences reliable as a product scales. In my current work, that has meant building AI-assisted design-to-code workflows, component parity analysis, contract-driven generation, and validation and repair loops that reduce drift and make complex development workflows safer.

That background maps closely to the HR Product team's challenge: translating complex HRIS, time, benefits, and talent requirements into coherent, performant, accessible product surfaces. I enjoy working directly with PM and design partners, turning ambiguous requirements into implementation paths, making autonomous technical tradeoffs, and building systems that let teams move quickly without fracturing the product into one-off patterns.

Rippling's model, bringing HR, IT, finance, and employee lifecycle operations into one system, is exactly the kind of environment where strong frontend architecture can create real leverage. I would be excited to help build the interfaces, workflows, and underlying systems that make that complexity feel simple.

Sincerely,

Brian Brady
